The Qwater Well Developer is designed to quickly develop wells by removing clays and silts, and repair damage to the borehole wall caused by drilling. Proper well development also greatly reduces water turbidity while increasing well yield. A properly developed well saves sampling time and produces more representative formation water samples for laboratory analyses. Although designed to be durable, the **Environmental Series** Qwater Well Developers are priced to be disposable after each well use to prevent cross-well contamination, while the **Production Series** Qwater Well Developers are designed to provide many years of use.

Advantages of Surge Block Method

- Most effective way to develop any well
- Properly developed wells can produce 2 to 10 or more times the water than undeveloped or poorly developed wells
- Only the surge block method backwashes the well screen, removing clay bridges
- Surging produces more water with less color and turbidity
- Properly developed wells save water sampling time by reaching stability quicker than turbid, poorly developed wells

Advantages of Qwater Well Developers

- Flexible wiper seals the tool to the casing/screen and creates suction to pull water into the screen (a feature not available with other methods)
- Constructed of environmentally inert materials
- Ball check valve prevents water from flowing back into the well and will not clog with sediments
- Environmental Series Qwater Well Developers are capable of lifting water with ball check valve over 50 feet
- Production Series Qwater Well Developers are capable of lifting water with ball check valve over 100 feet
- One-person operation, which is fast and saves time
- Environmental Series Qwater Well Developers are inexpensive and disposable after each use (prevents cross-well contamination)
- Production Series Qwater Well Developers are reusable many times
- Qwater Well Developers are shipped individually in sealed clear-plastic bags
